Upgrading to Version 2025-09-03

Learn how to upgrade your Notion API integrations to the latest API version

We've released **Notion API version** `2025-09-03`, introducing first-class support for multi-source databases. This enables a single database to contain multiple linked data sources — unlocking powerful new workflows.

For more information about data sources, see our FAQs.

However, this change is not backwards-compatible. Most existing database integrations must be updated to prevent disruptions.

> ❗ **Code changes required**
>
> If your integration is still using a previous API version and a user adds another data source to a database, **the following API actions will fail:**
>
> - Create page when using the database as the parent
> - Database read, write, or query
> - Writing relation properties that point to that database
